

ENUM DNS Quality TF

- Triggered by DNS WG Action Item 52.5: Carsten Schiefner to write a proposal for performing regular lameness checks in E164.ARPA and actions to follow
- AI approached by assembling people for a Task Force to round off the problem space and to eventually propose possible solutions to the ENUM WG
- Issue is not merely technical, but also political: Ad-Hoc TF composed accordingly
- Similar efforts (proposed lameness checks by the NCC, IANA delegation checks) are watched and synchronized with

ENUM DNS Quality TF

- Ad-Hoc TF met by email and for a lunch meeting during RIPE 53
- First thoughts:
 - Rather impossible to tell or even mandate an ENUM Tier 1 registry to be compliant to certain operational requirements
 - Therefore no sanctions
 - One solution would be to write a document containing operational recommendations („How we would run it“) and spread that word
 - Encourage Tier 1 registries to let themselves be monitored by third parties
 - These third parties can be part of a Tier 1 peer group
- Ongoing work, progress will be reported at RIPE 54 or also inbetween if necessary
