What's the Problem?

- Some networks use unallocated IP address space
- That address space will soon be allocated
- This could be problematic

Which /8s?

- 1 (massive private use)
- 5 (Hamachi)
- 42 (HP Procurve 700wl etc...)
- And there are plenty more out there

How does this affect operators?

- Enterprises may want/need to renumber
- ISPs **will** get support calls

What can operators do about it?

- Wait?
- Suggest using IPv6?

Questions?
